

IN THE SPECIFICATION

Please replace the paragraph beginning at page 47, line 11 with the following rewritten paragraph:

“Substantially free of wax particles” means that in observing the cross section of a toner by a transmission type electron microscope (TEM) photograph, wherein the toner has a volume-average particle diameter of from 3 to 12  $\mu\text{m}$ , a half value width of a number-average particle diameter of particulate wax contained therein, when the cross section of the toner is observed, of 0.06  $\mu\text{m}$  or less, and wherein the distribution of particulate wax having an average particle diameter of 0.01  $\mu\text{m}$  or more throughout the toner particle satisfies the following equation:

$$(A/B)/(C/D) \leq 0.1$$

wherein A is total area of wax particles contained in outermost layer to a depth of 0.1  $\mu\text{m}$ ;

B is total area of outermost layer;

C is total area of wax particles contained in remainder of toner particle (at a depth of greater than 0.1  $\mu\text{m}$  from the surface of the particle); and

D is total area of said remainder of toner particle,

wherein all areas are measured as observed in a cross section of said toner particle through a center point of said toner particle.
